

Office Documents Will Not Open

Article Number: 154 | Rating: Unrated | Last Updated: Fri, Jun 30, 2017 at 1:08 PM

This article is applicable to any file-type in Windows, but this particular issue with Office has been experienced at Stickman.

If a Word or Excel document does not open properly, or the application throws an error, check that the icon next to those file-types looks as expected. For example, it has been experienced that Excel files with the .xls extension had the generic Office icon (orange box) and would not open correctly; those ending .xlsx had the normal Excel icon (green) and would open. Read on if you cannot see the file extensions in your file viewer.

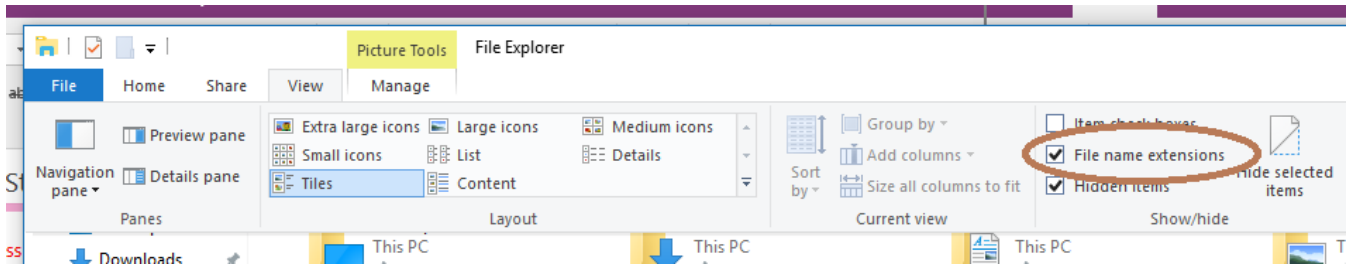

It is easy to remind Windows which application should open which file-type: right-click one of the files with the incorrect association, select *Properties*. Click the *Change* button and search for Excel (or the most appropriate program).

Viewing File Extensions

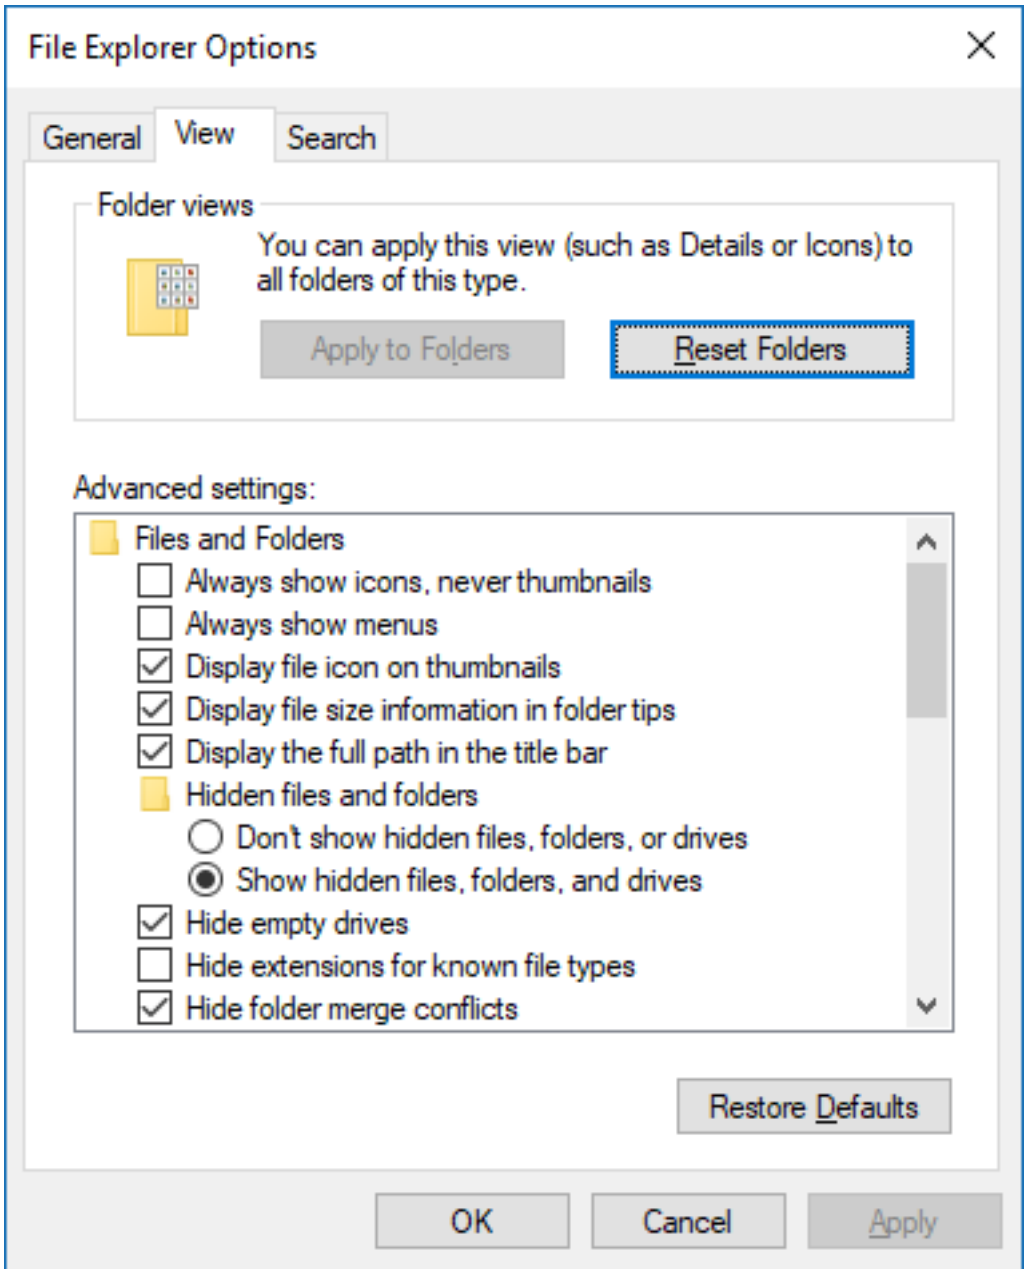

File extensions are often hidden by default, the method for being able to see them varies, but on Windows 10:

1. Open *File Explorer* (Win+E);
2. Click the *View* menu;
3. Tick the *File name extensions* box;
4. All files will now show their extensions.

This method works for all recent versions of Windows:

1. Click the *Start* menu;
2. Type *folder options*;
3. Click the appropriate search result (probably *File Explorer Options*);
4. Select the *View* tab;
5. Untick the *Hide extensions for known file types* option.
